 Subject: TOXIC PIT CLEAN UP :(
 Date: Thursday, December 11, 2014 8:30:14 PM

Dear Mr. Miller,

Thank you, I would only like to make suggestions concerning the clean up. I would suggest that the **1st row** of sheet metal be put as far away from the waste pits, out as close to the original San Jacinto River pathway for insurance. Then move inward 50' to 80' in towards the pit and put a **2nd row** of sheet metal; this is were I think they made a mistake in the past, not having that **2nd row** of sheet metal as a backup and maybe even a **3rd row**, starting way out on **1st row**, moving inwards towards the most toxic areas of the pits to be safe. Since the water is only 2' to 5' deep, pump it out or allow the water to evaporate, instead of going straight to the pits & start driving directly into the poison; that is what happened last time, which killed everything. Now that the wildlife has returned we need to not make the same mistake twice.

This will give us a dry zone in case any chemicals accidentally get spilled during removal. This will also allow the Cherry Pickers to walk down in the dry zone; allowing them to dig a huge hole and let them load either trucks or barges with the waste to haul off. Then as we walk the Cherry pickers out of the dry zone, scrape off the top layer of soil, incase of any spill. The final step would be to pull the sheet metal back out, letting mother nature fill the pit back in with water.

When they did the cap, they put tons of rock on top of the pit, then started driving the sheet metal; the exact opposite of what should have happened. They put all that weight & then the vibration from the pile driving which simply caused the rocks to sink; also doing this in what I would call a Huge Sand Box. They also drove the sheet metal in & around the pits, stirring it up, that is when Tracy & I got hit hard with the poison. We were swimming, high tide came in, and thousands of dead fish surrounded us; after that we both got very sick. They did not warn anyone and we thought it was a simple bulk head being installed; which we later found out about the cap; no one warned us of the construction, which I am not an attorney, but I think that makes it gross negligence. An attorney explained to me that the Mega Sand is not responsible, explaining it like this: "If you open a trunk of a car and there was a dead body in it, that does not mean you murdered anyone, you simply opened the trunk".

My dad, brother & myself owned a construction company for over 30 years and are familiar with toxic sites. Do you remember "Kennedy Heights" off Cullen, where they had pits soaking telephone poles in chemicals, well they covered them up and built a neighborhood on top of those pits. Pas-Key Construction company was putting in brand new water lines and found it; so we were directly involved in that mess. We had to go around the entire neighborhood passing out flyers warning them of the dangers to prevent getting sued too; which none of the company's involved with the San Jac. pits did not do, which equals gross negligence. Game Wardens found it in '05, Ike '08 blew the chemicals onto our land. I was one of three people who stayed, I had a wet suit & life jacket on and was swimming around in 8' of water trying to save mine & my neighbors stuff, that is when my skin damage got really bad & I was sick all the time.

The reason I know Ike '08 is when the poison was leaking is because after that all my trees died. In '94 flood no trees died, in '98 floods, 2 floods within 2 weeks, water knee deep on my land & again no trees died, after Hurricane Ike '08 all my trees died except a few trash trees, a total of 23 trees in 1.5 years time, on 1/2 acre piece of land. They died from the top down and simply started falling out of the sky, I was forced to cut them down before someone got killed or caused house damage.

I have plenty of pictures of dead fish during the time period of the pile driving, as well as, pictures of the 2 Eagles that finally returned to the area; isn't it highly illegal to mess with Eagles

& their habitat, nesting and feeding areas? Enclosed is pictures of '98 flood & Ike '08 floods.

Thank you for your help, time & attention concerning this matter, wow, & that is me trying to keep it short. LOL. Please notice my forehead before & after Ike'08, as well as, picture of my house during Ike '08, I also have a ton of other pictures I can get to you, showing the timeline.

Thank You For Everything, :)

Ps. Who do I call to complain about all these barges on the north side of I-10? They buy 1 piece of land & think they own the entire lake; not only that, but the next hurricane or big tropical storm will cause the barges to come loose, like in '94 flood, knocking I-10 & the train track bridge completely off their foundations; shutting down I-10 & the railroad. The only other way across the river is to go all the way up to highway 90 bridge. All of those barges should be tied to their land they own and not all out in the middle of the lake, as if they own the entire lake. A huge disaster is on it's way if this happens. :(
